Potato Storage

- Active against Dry Rot, Gangrene, Silver Scurf and Skin Spot
- Dust formulation for easy application
- Long shelf life
- Keeps potatoes firm and bright

During long term storage tuber disease may lead to losses of both quality and quantity. Treat the crop with **HYKEEP** and protect it's future.

Gangrene

- develops in store causing tubers to rot
- infection is often through wounds due to mechanical damage
- is encouraged by low temperatures during lifting and storage

HYKEEP treatment decreased Gangrene infection by an average **73%** compared to untreated tubers.

Silver Scurf*

- develops in store, reduces quality, particularly for the washed pre-pack trade.
- disease spreads to blemish the entire tuber surface
- higher disease loadings also cause moisture loss so tubers weigh less.

Agrichem[®] (International) Limited

In a six trial series for Gangrene and Silver Scurf control **HYKEEP** compared favourably with the thiabendazole liquid standard.

HYKEEP also controls Dry Rot and Skin Spot* in store.

HYKEEP must be applied immediately after potatoes are loaded into store. A delay of 24 hours will lead to a reduction in disease control. Avoid excess soil or trash, as good contact with the tuber surface is essential. **HYKEEP** should be applied using appropriate equipment in order to ensure even application.

* Strains of *Helminthosporium solani* (Silver Scurf) and *Polyscytalum pustulans* (Skin Spot) resistant to thiabendazole, and other benzimidazoles are known to exist. DO NOT TREAT potatoes with products containing these active ingredients more than once in their cropping cycle.

Hykeep contains 2%w/w thiabendazole

ALWAYS READ THE LABEL. USE PESTICIDES SAFELY.
